

Jorge Félix Peguero Solís

Currently pursuing an AAS in Artificial Intelligence at Houston Community College

Hands-on experience across Machine Learning, Computer Vision, and NLP. Additional background in computer virtualization, HTML, CSS, and JavaScript.

AI in Manufacturing: Amazon's application

This research paper explores how Artificial Intelligence is transforming the manufacturing industry, analyzing Amazon's use of AI across supply chain management, warehouse operations, and defect detection.

Key Findings:

- 75% faster inventory identification and storage
- 25% reduction in processing time
- 15% fewer workplace injuries — creating a safer working environment

Then, I proposed an AI Worker Assistance System combining IoT, RAG, and Computer Vision to support factory workers in real time.

AI in Government and Public Sector

This paper examines the advantages of AI adoption in government and the public sector, analyzing Estonia's national "Kratt" strategy, with around 25 active AI projects across public services.

In this paper I proposed an NLP-based job matching system for unemployed citizens, proposed for implementation within Spain's unemployment benefits system ("el paro"). The system is designed to:

- Speed up the job-matching process by automatically connecting candidates with relevant openings
- Reduce government costs on unemployment benefits by placing citizens into jobs faster

Real-World Applications

Through this course, I learned how AI is applied across different industries and sectors, and how to critically analyze real-world cases and their outcomes. This gives me a broad understanding of how AI impacts the world economically, socially, and ethically. This perspective allows me to design AI systems that are tailored to a specific industry's needs and generate real, positive impact.
